Cal OES SOUTHERN REGION

Natural Gas Release, Porter Ranch, Los Angeles County, SPILL: 16-7798 – FINAL

On 12/24/16 at 1413 hours, the California State Warning Center (CSWC) received a report from Southern California Gas Company (SoCal Gas) advising of an unknown amount of natural gas vapor releasing from the Aliso Canyon Storage Facility, wellhead #SS25. The release was discovered on 12/24/16 at approximately 0745 hours as part of daily patrols and inspections a very slight and intermittent observation of methane was detected utilizing infrared camera technology (FLIR) at the #SS25 wellhead at the Aliso Canyon Storage Facility.

- On 12/28/16 at 1445 hours the CSWC received an update from SoCal Gas. At 1045 hours South Cal Gas Company used an infrared camera to verify the off gassing had stopped. This verification was observed by onsite personnel from the California Public Utilities Commission (CPUC) Safety and Enforcement division and confirmed the gas had stopped releasing.
- The total quantity of gas estimated to have entered the atmosphere is approximately 1 standard cubic foot throughout this period there was no detectable odor and no indication of hazard to human health, safety, or the environment.

WEATHER SYNOPSIS BY REGION

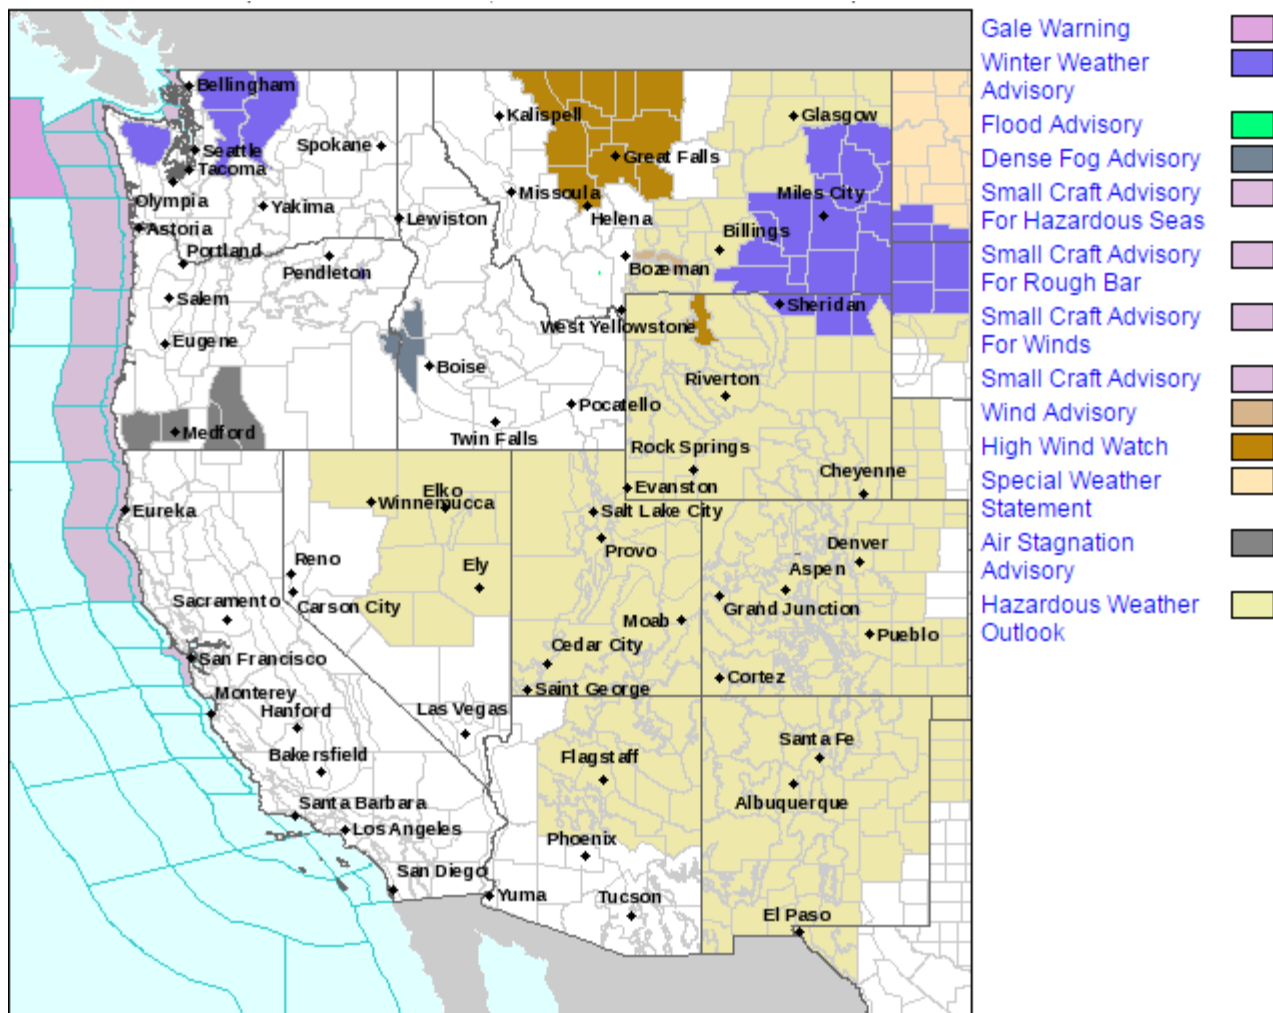

NORTHERN CALIFORNIA

Dry weather will be over Northern California the rest of this work week as higher pressure moves over. This is likely to set up some rather persistent valley inversions, although just patchy overnight and morning valley fog is expected. However, air quality may begin to degrade significantly under the strong inversions. Late this week a low over southern California may bring some showers to the greater Tahoe area Friday. A weak weather system will probably move into Northern California from the Pacific Northwest later Friday and exit to the south Saturday with the best chances of showers from that system over our eastern and far northern areas. A rather cold system looks like it might arrive from the north New Year's Day with fairly light precipitation returning to the northern and eastern areas in particular. The path of this system will be the key as to how low snow levels become over northwestern counties. That low will probably move into the Great Basin Monday, followed by a slow warming trend starting next Tuesday as off high pressure becomes centered off shore and affects the region. High temperatures will generally be above normal for the next few days, then drop to below normal values for early next week. Overnight lows will generally be below seasonal normals through the 7 day period. Expect a few areas to have periods gusty winds over the next 7 days, either north to northeast or southerly in those cases.

SOUTHERN CALIFORNIA

Temperatures will be around 10 degrees above normal and minimum humidity will drop in the single digits and teens away from the Central Valley through Thursday as a ridge of high pressure remains over California. Maximum temperatures will be in 50s to low 60s across the mountains and San Joaquin Valley, with 70s to low 80s in the valleys of Southern California. Northeast to east winds of 10 to 20 mph with gusts to 35 mph will continue to surface across the mountains and below the canyons and passes of Southern California through Thursday afternoon. Showers with less than a half inch of rainfall will move across the area Friday as a weak low pressure area from the south moves inland. The snow level will be around 8,000 feet. A low pressure area from the north will continue to bring showers to the area Saturday. This low will cause temperatures to become well below normal and the snow level to drop to between 4,000 and 5,000 feet. Showers will continue to move across the region at times Sunday through early next week as a Pacific trough develops over the West Coast. Temperatures will remain below normal Sunday through early next week. South to west winds of 20 to 40 mph with gusts to 60 mph will surface across the wind prone mountain and desert areas at times Saturday through early next week.
